N. FRIESEN

The genus *Allium* L. in the flora of Mongolia

With 15 Figures

Summary

A taxonomic revision of the genus *Allium* in Mongolia is presented including a key, complete synonymy and distribution for all taxa with distribution maps. A total of 44 species is recognized and grouped into two subgenera and 11 sections. Most of the species (96%) belong to the subgenus *Rhizirideum*.

Zusammenfassung

Eine taxonomische Revision der Gattung *Allium* in der Mongolei einschließlich eines Bestimmungsschlüssels, der gesamten Synonymie und der Verbreitungskarten für alle Arten wird vorgelegt. 44 Arten aus zwei Untergattungen und 11 Sektionen werden akzeptiert. Die meisten Arten (96%) gehören zur Untergattung *Rhizirideum*.

Introduction

In the last floristic work (GRUBOV 1982) 31 species of *Allium* were reported from all over Mongolia. However, this number does not represent the full diversity of this genus in Mongolia. During studies made on the Siberian onions the present author described some new species which are also common in the Mongolian flora (FRIESEN 1985b, 1987, 1988a, b; FRIESEN and NAMZALOV 1985). During the last eighties years the Soviet and Mongolian botanists have made many joint expeditions in Mongolia. As a result of these missions some more *Allium* species were added to the Mongolian flora (GUBANOV and KAMELIN 1988, 1992; GUBANOV et al. 1990; KAMELIN et al. 1991, 1992). Moreover, as a result of the joint expeditions by the Institute of Plant Genetics and Crop Plant Research (IKP), Gatersleben and Mongolian botanists (Institute of Botany, Ulan Bator) especially for *Allium* a detailed description of ecology, distribution and practical uses of many Mongolian species were made (HANELT 1985; HANELT et al. 1986; PISTRICK et al.

1988; SANČIR et al. 1989). In 1992 SANČIR published a short list of Mongolian *Allium* species in which 40 taxa were listed (35 species and five subspecies). In the opinion of the present author the Mongolian flora has 44 *Allium* species. These species form a single phytogeographical and taxonomic unit in Mongolia and South Siberia, out of which more than half are endemic to this region (FRIESEN et al. 1993); 96% of the Mongolian species belong to the subgenus *Rhizirideum* and within this subgenus 50% belong to the two sections: *Rhizirideum* s. str. (eight spp.) and *Reticulato-Bulbosa* (13 spp.). Furthermore, in the Mongolian region, the number of species increases from North to South and from West to East. For example, 22 species were found in Mongolian Altai, 20 species in Khangaj, 16 species in Khentej and in East Mongolia occur only 12 species.

The Eastern Asian species *Calostordum neriniflorum* HERBERT is often included in the genus *Allium* L. as *A. neriniflorum* (HERBERT) BAKER (XU 1980; GRUBOV 1982; and other). In my opinion (FRIESEN et al. 1986) it belongs to the

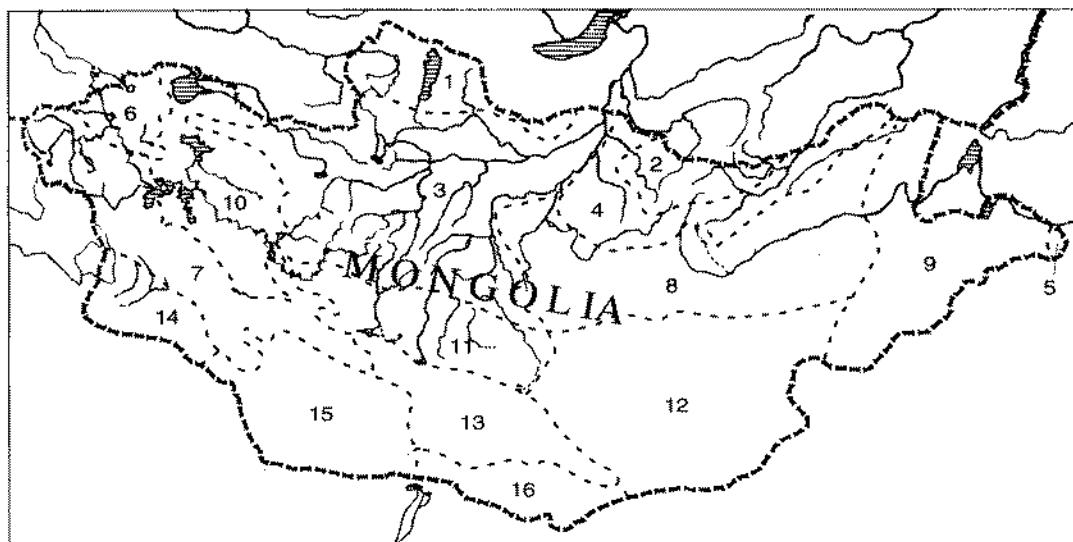

Fig. 1

Botanical-geographic regions of Mongolia (GRUBOV 1982)

1 - Khubsugul; 2 - Khentej; 3 - Khangaj; 4 - Mongolian Daurian; 5 - Great Khingan; 6 - Khotbo; 7 - Mongolian Altai; 8 - Middle Khalkha; 9 - East Mongolia; 10 - Depression of Great Lakes; 11 - Valley of Lakes; 12 - East Gobi; 13 - Gobi Altai; 14 - Dzungarian Gobi; 15 - Transaltai Gobi; 16 - Alashan Gobi

independent genus and therefore has been excluded from the Mongolian *Allium* species in the present paper.

Material and methods

Herbarium material was studied from the following herbaria: B; GAT; LE; MNA; NS; M. Popov Herbarium from the Central Siberian Botanical Garden, Novosibirsk; TK.

The nomenclatural part is based on main floristic works of Mongolia and the neighbouring countries (LEDEBOUR 1852; REGEL 1875, 1887; KRYLOV 1929; AIRY SHAW 1931; VVEDENSKY 1935, 1971; PAVLOV and POLJAKOV 1958; EGOROVA 1977; KITAGAWA

1979; XU 1980; KHANMINCZUN 1984; BARKALOV 1987; FRIESEN 1987, 1988; GUBANOV and GANBOLD 1989; SANCIR et al. 1992; and others).

The synonymy is followed in each case by the Mongolian name.

Chromosome number for most of the species were determined by the present author (FRIESEN 1985, 1986b, 1991). Supplementary data about chromosome number has also been taken from the last chromosome atlas of the Soviet territory (AGAPOVA et al. 1990). In the case of unpublished chromosome numbers, the author and the origin of the studied specimen were indicated.

The phytogeographic regions of Mongolia for showing the distribution of each species adopted were from GRUBOV (1982).

Key for determination of Mongolian *Allium* species

1a. Bulbs usually several, or 1–3, rhizome distinctly developed	2
1b. Bulb usually solitary, rhizome indistinct	44
2a. Leaves several, lorate, linear, semicylindric or cylindric, not narrowed into a petiole at base	3
2b. Leaves usually 2, ovate 2–6(8) cm broad, narrowed into a petiole	A. <i>microdictyon</i> PROKH.
3a. Leaves fistulose (cylindric and robust)	4
3b. Leaves flat, semicylindric or canaliculate	11
4a. Bulb ovoid-cylindric, thick (1.5) 3–4(6) cm diam., tunic red-brown. Leaves and scape with thickened base	5

4b. Bulb cylindric to ovoid-cylindric, 0.6–1.5 cm diam., tunic black-white, membranous. Leaves and scape with-out thickened base	6
5a. Scape robust. Leaves 8–20 mm thick. Bulbs 2–4(6) cm in diam. Flowers whitish-cream, pedicels 1.5–2 times longer than tepals	<i>A. altaicum</i> PALL.
5b. Scape solid. Leaves 5–10 mm thick. Bulbs 1.5–2.5 cm in diam. Flowers white, pedicels 3–4 times longer than tepals	<i>A. galanthum</i> KAR. et KIR.
6a. Filaments connate only at base, flowers white, pale purple to purple-red	7
6b. Filaments 1/3–3/4 of their length connate into a tube. Flowers purple	<i>A. monadelphum</i> LESS. ex KUNTH
7a. Pedicels unequal, shorter than tepals, sometimes interior ones almost as long as tepals. Filaments 1/3–1/2 of tepal length	8
7b. Pedicels subequal, 1.5–3(4) times longer than tepals. Filaments equalling tepals, slightly shorter or longer	9
8a. Scape and sheaths smooth, green	<i>A. schoenoprasum</i> L.
8b. Scape and sheaths scabrous-denticulate along the edges, dove-coloured	<i>A. karelinii</i> POLJAK
9a. Umbel hemiglobose or almost fasciculate. Pedicels green. Filaments nearly equalling or slightly shorter than tepals. Tepals 5–6(7) mm long	10
9b. Umbel fasciculate, many flowered. Pedicels black. Filaments longer or equalling tepals. Tepals 7–8(9) mm long	<i>A. ledebourianum</i> SCHULT. et SCHULT. f.
10a. Umbel hemiglobous, many flowered, dense. Bulbs cylindric-biconic, bulb tunic greyish, papery	<i>A. maximowiczii</i> REGEL
10b. Umbel almost fasciculate, scanty, lax. Bulbs ovoid, bulb tunic brown, membranous	<i>A. oliganthum</i> KAR. et KIR.
11a. Bulb tunic coriaceous, thin coriaceous, membranous, papery, unbroken or breaks up into parallel fibrous parts, not reticulate	12
11b. Bulb tunic reticulate-fibrous	31
12a. Bulb tunic membranous, breaking up into loosely parallel fibrous stripes	24
12b. Bulb tunic membranous or thin-coriaceous, mostly unbroken	13
13a. Bulb ovoid-conical to ovoid	14
13b. Bulb thin cylindric, almost undistincted, scarcely developed	22
14a. Leaves flat or sometimes keeled, linear, smooth	15
14b. Leaves semicylindric, canaliculated, smooth or scabrous	19
15a. Leaves relatively broad, always broader than scape. Bulbs 1–2 cm in diam.	<i>A. senescens</i> L.
15b. Leaves narrow, or equaling to the broad of the scape	16
16a. Leaves 1–3 mm broad, shorter than middle scape	17
16b. Leaves 2–4 mm broad, longer than middle scape, often reaching the umbel	18
17a. Bulbs several in rhizome. Umbel hemiglobose. Pedicels green	<i>A. austrosibiricum</i> FRIESEN
17b. Bulbs 1–2 in rhizome. Umbel hemiglobose to fasciculate. Pedicels often violet	<i>A. dauricum</i> FRIESEN
18a. Pedicels 1.5–2 times longer than tepals. Bulb tunic violet	<i>A. burjaticum</i> FRIESEN
18b. Pedicels equal to or slightly longer than tepals. Bulb tunic white	<i>A. tytthocephalum</i> SCHULT. et SCHULT. f.
19a. Tepals pink or pink-violet	20
19b. Tepals yellow, usually with pink-violet midvein	21
20a. Umbel hemiglobose to subglobose, dense. Pedicels equal or to slightly longer than tepals. Scape semierect	<i>A. prostratum</i> TREV.
20b. Umbel fasciculate to subglobose, friable. Pedicels 3–5 times longer than tepals. Scape straight	<i>A. rubens</i> SCHRAD.
21a. Bulbs several in rhizome. Leaves thin, 1–1.5 mm broad, semicylindric, equal half of the scape	<i>A. tuvinicum</i> (FRIESEN) FRIESEN
21b. Bulbs 1–3 in rhizome. Leaves 1.5–3 mm broad, in lower part semicylindric, in upper part canaliculate, up to 2/3 of the scape length	<i>A. stellerianum</i> WILLD.

22a.	Pedicels subequal, 1.5–3 time longer than tepals	23
22b.	Pedicels unequal, 3–8 times longer than tepals	<i>A. anisopodium</i> LEDEB.
23a.	Pedicels drooping. Leaves soft, spreading from scape	<i>A. vodopjanovae</i> FRIESEN
23b.	Pedicels straight. Leaves hard, erect to scape	<i>A. tenuissimum</i> L.
24a.	Bulb usually one or rarely several on vertical or ascent rhizome, very well developed. Bulb tunic thin-or usually dense-coriaceous, red-brown	27
24b.	Bulbs several in horizontal rhizome, scarcely developed caespitose. Bulb tunic fibrous or subreticulate only at base	25
25a.	Tepals pink, 4–6 mm longer. Inner filaments oblong, broadened at base in 1/2–2/3 of their total lengths, toothed	26
25b.	Tepals pink to purple-red, 7–8 mm long, elliptic. Inner filaments broadened at base, without teeth	<i>A. mongolicum</i> REGEL
26a.	Bulb tunic fibrous, coriaceous. Inner filaments broadened at base up to 2/3 of their total lengths	<i>A. bidentatum</i> FISCH. ex PROKH.
26b.	Bulb tunic subreticulate fibrous. Inner filaments broadened at base up to 1/2 of their total lengths	<i>A. polyyrrhizum</i> TURCZ. ex REGEL
27a.	Leaves broad linear, flat, 5–20 mm broad	28
27b.	Leaves narrow linear, semicylindric canaliculate or flat, 1–6 mm broad	29
28a.	Leaves narrowed to the base and the tip, obtuse. Bulb tunic thin-coriaceous to papery, outside black to dark brown. Tepals pink to pink-purple	
	<i>A. platyspathum</i> subsp. <i>amblyophyllum</i> (KAR. et KIR.) FRIESEN	
28b.	Leaves cuneate, tip acute. Bulb tunic membranous, red-brown. Tepals yellowish-green to pale yellow	<i>A. obliquum</i> L.
29a.	Leaves semicylindric, smooth 1–2 mm broad. Spathe with a beak of equal length in the base of spathe	30
29b.	Leaves flat, linear, scabrous, 4–6 mm broad. Spathe with shorter beak	
	<i>A. hymenorrhizum</i> LEBED.	
30a.	Plants 10–18 cm high. Tepals pink or pink-purple	<i>A. subtilissimum</i> LEDEB.
30b.	Plants 30–80 cm high. Tepals pale-yellow	<i>A. condensatum</i> TURCZ.
31a.	Bulb long, rarely shorter, conical, conic-cylindric or narrowly cylindric on oblique rhizome	32
31b.	Bulb short, conic on thick horizontal rhizome. Flowers star shaped	<i>A. ramosum</i> L.
32a.	Tepals white or yellow, sometimes at the tip and mid-vein reddish-violet	33
32b.	Tepals pink, pink-lilac or purple	35
33a.	Leaves semicylindric or narrow cylindric, smooth or scabrous. Tepals white, often with violet mid-vein	34
33b.	Leaves flat, 3–6 mm broad, long edge scabrous	<i>A. flavidum</i> LEDEB.
34a.	Leaves narrowly cylindric, fistular, 1–5 mm broad. Bulb ovoid-conical, 3–5 cm high. Tepals white	
	<i>A. leucocephalum</i> TURCZ. ex LEDEB.	
34b.	Leaves semicylindric, solid, scabrous, 1.5–2 mm broad. Bulb long and conical, 5–8 cm high. Tepals white, at the tip and mid-vein pink-violet	
	<i>A. schischkinii</i> K. SOBOL.	
35a.	Leaves semicylindric, 1–2 mm broad	36
35b.	Leaves flat, 2–8(10) mm broad	38
36a.	Leaves sheathing 1/3–1/2 of the scape	37
36b.	Leaves sheathing only at the base of the scape. Flowers dark-red	<i>A. eduardii</i> STEARN
37a.	Leaves smooth. Umbel globose or usually narrowly hemiglobose. Pedicels 1.5–2 time longer than tepals. Scape erect, 25–45 cm high	
	<i>A. clatrathrum</i> LEDEB.	
37b.	Leaves scabrous. Umbel hemiglobose, dense. Pedicels equal to or shorter than tepals. Scape short, semierect, not more than 20 cm high	
	<i>A. ubsicolum</i> REGEL	
38a.	Pedicels 1.5–2 times longer than tepals	39
38b.	Pedicels somewhat or 2 times shorter than tepals	41

- 39a. Tepals pink or pink-lilac, with a strong dark-purple mid-vein. Inner filaments often with several acute teeth at each side 40
 39b. Tepals pink or pale-red, with faint mid-veins. Inner filaments with one obtuse tooth at each side *A. strictum* SCHRAD.
 40a. Inner tepals pale-lilac, outer with dark-purple mid-vein. Inner filaments with one acute tooth at each side *A. chamarense* M. IVANOVA
 40b. All tepals pink-lilac, with dark-purple mid-veins. Inner filaments with several acute teeth at each side *A. splendens* WILLD. ex SCHULT. et SCHULT. f.
 41a. Leaves sheathing 1/3–1/2 of the scape. Inner filaments with one short tooth of each side or undentate 42
 41b. Leaves sheathing scape only at base. Inner filaments with one, often bifurcate tooth at each side *A. malyschevii* FRIESEN
 42a. Leaves narrowed to the base and the tip, crescent curved. Inner filaments undentate 43
 42b. Leaves linear, straight. Inner filaments with one short acute tooth at each side
 *A. amphibolum* LEDEB.
 43a. Scape 25–40 cm high. Leaves 2 times shorter than scape. Inner filaments at base broadened, 2 times broader than outer ones *A. bogdoicum* REGEL
 43b. Scape 10–15 cm high. Leaves somewhat shorter than scape. Filaments equal *A. pumilum* VVED.
 44a. Umbels with flowers and sometimes also with bulbils, globose. Pedicels bracteolate *A. macrostemon* BUNGE
 44b. Umbels only with flowers, hemiglobose. Pedicels ebracteolate or only with a few bracteoles *A. pallasi* MURRAY

Genus *Allium* L. – Songino

1753, Sp. Pl. 294

Lectotypus: *A. sativum* L.

Subgenus *Rhizirideum* (G. DON ex KOCH)

Mongolian name: Altajn S., Zerleg Songino.

Typus: Altai (LE!).

Chromosome number: $2n = 16$.

Distribution and habitat in Mongolia: Khubsugul, Khentej, Khangaj, Khobdo, Mongol. Altai, Depres. Great Lakes (mt. Dzun-Dzargalant), Gobi-Altai, Dzung. Gobi (Baitag-Bogdo-Nuru). – In rocky and stony places (Fig. 2).

Distribution generale: Russia (South Siberia); Kasachstan (Altai, Tarbagatai); China (Dzungaria, Manshuria).

Sectio *Schoenoprasum* DUMORT.

1827, Fl. Belg.: 140 p.p.; KOCH 1837, Syn. Fl. Germ.: 720.

Typus: *A. schoenoprasum* L.

4. *A. schoenoprasum* L. 1753 Sp. Pl.: 301; REGEI 1875 in Acta Horti Petrop. 3 (2): 77 pro max. p.; VVEDENSKY 1935 in Fl. SSSR 4: 190, p.p.; EGOROVA 1977 in Rast. Centr. Asii 7: 56; XU 1980 in Fl. reipubl. popul. Sinicae 14: 253; GRUBOV 1982 Opred. sosud. rast. Mongolia: 65; FRIESEN 1987 in Fl. Sib.: Araceae–Orchidaceae (4):

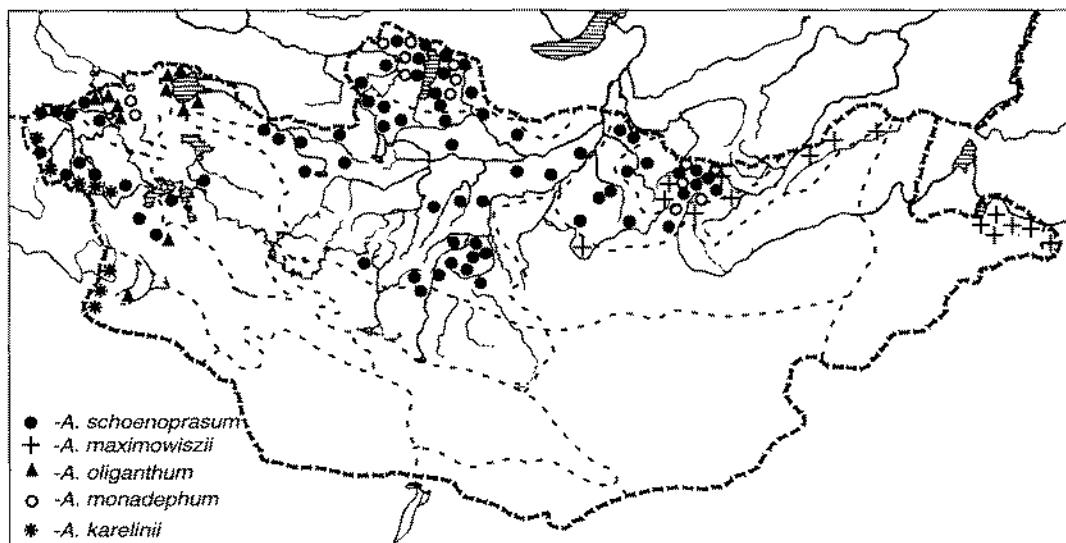

Fig. 3

Allium schoenoprasum; *A. maximowiczii*; *A. oliganthum*; *A. monadelphum*; *A. karelinii* – distribution in Mongolia

64; FRIESEN 1988 Lukovye Sibiri: 97; GUBANOV and GANDBOLD 1989 in Fl. Khangaja: 94; SANČIR et al. 1989 in Kulturpflanze 37: 135 – *A. raddeanum* REGEL 1875 in Acta Horti Petrop. 3 (2): 155.

Mongolian name: Chümcheel.

Typus: in alpestribus Sibiriae, Oelandiae (LINN).

Chromosome number: $2n = 16$.

Distribution and habitat in Mongolia: Khubsugul, Khentej, Khangaj, Khobdo, Mongol Altai (North West), Depres. Great Lakes (Dsergen-Gol, Dsabchan). – In damp meadows along rivers, in alpine meadows, in lakeshores and in stony slopes in alpine belt (Fig. 3).

Distribution generale: Europe; Russia (Siberia; Middle Asia (Saur-Tarbagatai)); China (Dzungaria); North America.

As in other regions, *A. schoenoprasum* is also polymorphic in Mongolia. A rather small form of this species grows in limestone rubbles in alpine region of Mongolian Altai, which has been described as var. *pumilum* BUNGE.

In M.G. Popov-Herbarium (Novosibirsk) some specimens of this species are identical with the type of *A. raddeanum* REGEL. These are very tall 50–80 cm, with leaves 15 mm broad and um-

bel upto 8 cm in diameter. However, all these forms differ only quantitatively and the qualitative differences could not be observed in the herbarium material.

5. *A. maximowiczii* REGEL 1875 in Acta Horti Petrop. 3 (2): 153; VVEDENSKY 1935 in Fl. SSSR 4: 194; KITAGAWA 1979 Neo-Lin. Fl. Mansh.: 167; GRUBOV 1982 Opred. sosud. rast. Mongoli: 65; FRIESEN 1987 in Fl. Sib.; Araceae-Orchidaceae (4): 63; BARKALOV 1987 in Sosud. rast. sov. Dal'nego Vostoka 2: 391; FRIESEN 1988 Lukovye Sibiri: 94 – *A. ledebourianum* auct. non SCHULT. et SCHULT. f.; XU 1980 in Fl. reipubl. popul. Sinicae 14: 254.

Mongolian name: Maksimowijzijn S.

Typus: In regione amurensi et ussuriente (LE!).

Chromosome number: $2n = 16$.

Distribution and habitat in Mongolia: Khentej, East Mongolia. – In meadows along rivers and streams (Fig. 3).

Distribution generale: Russia (East Siberia, Far East); China (Mansuria); Japan; Korea.

6. *A. karelinii* POLJAKOV 1950 in: Bot. mat. herb. Bot. (Leningrad) 12: 70; PAVLOV and POLJAKOV 1958 in Fl. Kasachst. 2: 168; VVEDENSKY 1971 in Opred. rast. Sredn. Asii 2: 68; EGOROVA 1977

in Rast. Centr. Asii 7: 56; GRUBOV 1982 Opred. sosud. rast. Mongoli: 65 – *A. schoenoprasum* f. *scaberrimum* KAR. et KIR. 1842 in Bull. Soc. Nat. Mosk. 15 (3): 507; XU 1980 in Fl. reipubl. popul. Sinicae 14: 254.

Mongolian name: Karellyn S.

Typus: Dzung. Alatau (LE).

Chromosome number: $2n = 16$ (orig.) Mongol. Altai, Delun Somon, 15 km NE Delun.

Distribution and habitat in Mongolia: Mongol. Altai (North-West). – In damp meadows in alpine belt (Fig. 3).

Distribution generale: Kasachstan (Dzungarskij Alatau, Saur-Tarbagatai, South Altai); China (Dzungaria).

7. *A. ledebourianum* SCHULT. et SCHULT. f. 1830
SYST. 7: 1029; LEDEBOUR 1852 Fl. Ross. 4 (1): 168; REGEL 1875 in Acta Horti Petrop. 3 (2): 152; KRYLOV 1929 Fl. zapadn. Sib. 3: 607, p.p., excl. var. *intermedium*; VVEDENSKY 1935 in Fl. SSSR 4: 194, p.p.; PAVLOV and POLJAKOV 1958 in Fl. Kasachst. 2: 169; FRIESEN 1987 in Fl. Sib.: Araceae-Orchidaceae (4): 62.

Mongolian name: Ledeburinym S.

Typus: In paludibus ad fl. Belaja Uba et Koksum (LE!).

Chromosome number: $2n = 16$.

Distribution and habitat in Mongolia: Mongol. Altai (North-West?). – In damp and swampy meadows in subalpine belt.

Distribution generale: Russia (West Altai); Kasachstan (Altai).

SANČIR (1992) listed this species for the Mongolian flora the first time, however, without any details of distribution. GUBANOV et al. (1990) indicated also this species from Mongolian Altai. But a study of this herbarium material by the present author showed that it did not *A. ledebourianum*, but belong to *A. platyspathum* subsp. *amblyphyllum* (KAR. et KIR.) FRIESEN (KAMELIN et al. 1991). However, true *A. ledebourianum* can be found in the north-west part of Mongolian Altai and therefore it may be included in Mongolian flora.

8. *A. oliganthum* KAR. et KIR. 1841 in Bull. Soc. Nat. Mosk. 14: 856; REGEL 1875 in Acta Horti Petrop. 3(2): 115; VVEDENSKY 1935 in Fl. SSSR 4: 195; EGOROVA 1977 in Rast. Centr. Asii

Allium platyspathum subsp. *amblyophyllum*; *A. ramosum*; *A. amphibolum*; *A. bogdoicum*

SANČIR (1992) reported for Mongolia also the typical subspecies *A. platyspathum* SCHRENK s. str. which has not been found in Mongolia. All specimens which are examined from Mongolia belong to subsp. *amblyophyllum*.

27. *A. subtilissimum* LEDEB. 1830 Fl. Alt. 2: 22; LEDEBOUR 1852 Fl. Ross. 4 (1): 173; REGEL 1875 in Acta Horti Petrop. 3 (2): 103; PAVLOV and POLJAKOV 1958 in Fl. Mongolian name: Anchil S., gogod.

Typus: In Siberia (LJNN).

Chromosome number: $2n = 32$.

Distribution and habitat in Mongolia: Khubsugul (Khatgal), Khentej, Mongol. Daur., Great Khingan, Khobdo (Ulegej), Middle Khalkha, East Mongol., Depres. Great Lakes, East Gobi (North), Gobi Altai, Dundu-Sajkhan. – In steppes, in dry saline meadows, in stony steppe slopes (Fig. 11).

Distribution generale: Russia (South Siberia, Far East); Kasachstan (South-East); China; Korea.

Some authors have determined the taller specimens of *A. ramosum* from East Mongolia as *A. tuberosum* ROTT. ex SPRENGEL. Possibly, these belong to the cultivated *A. tuberosum* which have become naturalized gone wild. However, except for large dimensions these specimens are not different morphologically from *A. ramosum*.

Sectio *Reticulato-Bulbosa* KAMEL.

1973, Florogen. anal. fl. gorn. Sredn. Asii: 239.

Typus: *A. lineare* L.

30. *A. amphibolum* LEDEB. 1830 Fl. Alt. 2: 5; REGEL 1875 in Acta Horti Petrop. 3 (2): 166; KRYLOV 1929 Fl. Zap. Sib. 3: 625, p.p.; VVEDENSKY 1935 in Fl. Sib.: Araceae-Orchidaceae (4): 84.

Mongolian name: Taumal S.

Typus: In Sibiria altaica, ad fl. Charysch (LE!).

Chromosome number: $2n = 48$.

Distribution and habitat in Mongolia: Khangaj (Khan-Khukhijn, Tarbagatai), Khobdo, Mon-

gol. Altai, Altai Gobi, Dzung. Gobi. – In rocks, in stony slopes in alpine belts (Fig. 11).

Distribution generale: Russia (Altai, Tuva); Kasachstan (Altai); China (?Mongol. Altai).

The inclusion of *A. amphibolum* within *A. splendens* sensu lato by SANČIR (1992) is not correct. This latter species shows distinct morphological features and belongs to a related, but different group (FRIESEN 1992). They can be distinguished rather easily by the filaments of their inner stambus: The *A. splendens* group has several teeth on each side of the inner filaments whereas the *A. amphibolum* group does not have any one on the inner stamens or only one short tooth on each side.

31. *A. bogdoicum* REGEL 1880 in Acta Horti Petrop. 6: 530 et 1887, 10 (1): 348; VVEDENSKY 1935 in Fl. SSSR 4: 151 et 1971 in Opred. rast. Sredn. Asii 2: 56; PAVLOV and POLJAKOV 1958 in Fl. Kasachst. 2: 145; FRIESEN 1987 in Fl. Sib.: Araceae-Orchidaceae (4): 84 – *A. schrenkii* auct. non REGEL: EGOROVA 1977 in Rast. Centr. Asii 7: 39; KHANMINCZUN 1984 in Opred. rast. Tuvin'skoi ASSR 263 – *A. strictum* SCHRAD. subsp. *schrenkii* (REGEL) SANČIR 1992 in HANELT et al. (eds.): The genus *Allium* – Taxonomic problems and genetic resources: 295, nomen nudum.

Mongolian name: Bogd-Uulyun S.

Typus: China, Dzungaria, in m. Bogdo (LE!).

Chromosome number: $2n = 32$.

Distribution and habitat in Mongolia: Khangaj (Khan-Khukhijn), Khobdo, Mongol. Altai, Dzung. Gobi (Baitag-Bogdo). – In dry alpine meadows (Fig. 11).

Distribution generale: Russia (South-East Altai, West Tuva); South-East Kasachstan; China (Dzungaria).

32. *A. chamarense* M. IVANOVA 1965 in Nov. syst. vyssh. rast. (Leningrad) 2: 296; FRIESEN 1987 in Fl. Sib.: Araceae-Orchidaceae (4): 85; GUBANOV and GANDBOLD 1989 in Fl. Khangaja: 93 – *A. flavidum* auct. non LEDEB.; PESHKOVA 1979 in Fl. Centr. Sib. 2: 219; GRUBOV 1982 Opred. sosud. rast. Mongoli: 64, p.p. – *A. leucocephalum* TURCZ. ex LEDEB. subsp. *chamarense* (M. IVANOVA) SANČIR 1992 in HANELT et al. (eds.): The genus *Allium* – Taxonomic problems and genetic resources: 295, nomen nudum.

Mongolian name: Khamardavaany S.

Typus: In Transbaikalia, Chamar-Daban, fl. Dsun-Baiga (LE!, isotypus NS!).

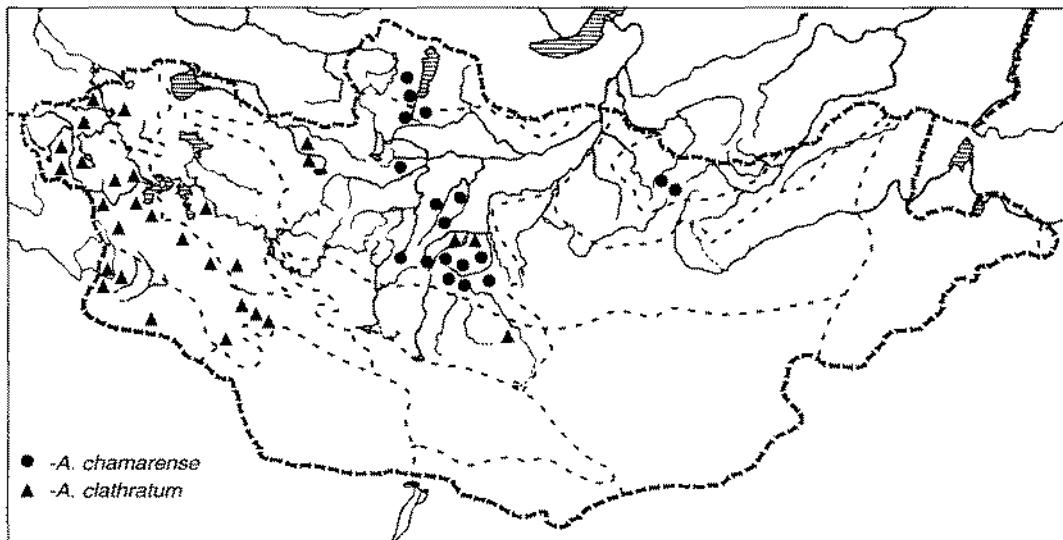

Fig. 12
Allium chamarensis; *A. clathratum* – distribution in Mongolia

Chromosome number: $2n = 16$.

Distribution and habitat in Mongolia: Khubsugul, Khentej, Khangaj. – In rocks and stony slopes in forest and subalpine belts (Fig. 12).

Distribution generale: Russia (East Siberia).

The inclusion of *A. chamarensis* in *A. leucocephalum* (SANČIR 1992) is erroneous. This diploid species belong to the polyploid complex of *A. splendens* sensu lato, because the stamens of the inner circle have several teeth on both each side.

33. *A. clathratum* LEDEB. 1830 Fl. Alt. 2: 18; REGEL 1875 in Acta Horti Petrop. 3 (2): 173; VVEDENSKY 1935 in Fl. SSSR 4: 145; EGOROVA 1977 in Rast. Centr. Sib.: Araceae-Orchidaceae (4): 159 – *A. tenue* G. DON 1827 Monogr. All.: 34 – *A. caricifolium* KAR. et KIR. 1841 in Bull. Soc. Nat. Mosk. 14: 854 – *A. semi-retschenskianum* REGEL 1878 in Acta Horti Petrop. 5: 63 – *A. albertii* REGEL 1878 in Acta Horti Petrop. 5: 632.

Mongolian name: Pallasiyn S.

Type: In Siberia (MW!).

Chromosome number: $2n = 16$.

Distribution and habitat in Mongolia: SANCIR (1992) listed this species for the first time for Mongolian flora but without any details of its distribution. I did not see herbarium material of this species from Mongolia. However, true *A. pallasii* can be found in the Dzungarian Gobi and therefore it may be expected also in the Mongolian flora.

Distribution generale: Russia (Altai); Kazakhstan (Middle Asia); China (Dzungaria).

Acknowledgements

The author is grateful to Dr. B. B. Namzalov (Ulan-Ude, Russia) for providing the Mongolian names of some species and to Dr. habil. P. Hanelt and Dr. K. Pistrick for critical remarks and suggestions and to Mrs. U. Tiemann for preparing the figures.
